

Policy Guidelines: Internal Data Usage & AI Governance

Version: 4.1 (Revised May 2025) **Subject:** Security, Privacy, and Internal Data Access

1. Data Classification Levels

To maintain strict access boundaries, all data is classified into four levels:

1. **Level 1 (Public):** Marketing taglines, public synopses, and genre labels.
2. **Level 2 (Internal):** Aggregate engagement scores, general sentiment, and regional trends.
3. **Level 3 (Managerial):** Financial budgets, marketing spend per title, and future roadmaps.
4. **Level 4 (Restricted):** Raw Viewer PII, SQL query logs, and unencrypted API keys.

2. Personal Identifiable Information (PII) Protection

- **Mandatory Rule:** No PII (Viewer names, specific addresses, credit card info, or phone numbers) may ever be processed or stored by the AI Assistant.
- **Anonymization:** All SQL tables used for analytics must use `viewer_id` or `uuid` as the primary key.
- **Geographic Masking:** Data may only be aggregated to the "City" level (e.g., "Mumbai"). No latitude/longitude or street-level data is permitted for assistant queries.

3. Financial Data Access Protocols

- **Constraint:** The AI Assistant is prohibited from surfacing raw financial budgets (`budget_millions`) unless the user is identified as having "Management" or "Finance" clearance.
- **Conflict Resolution:** If a query regarding budgets is received from a general user, the Assistant must respond: *"This information is restricted to Management-level users. Please contact the Finance department for access."*

4. AI Assistant Interaction Rules

- **Grounded Reasoning:** The AI must only provide answers based on the specific evidence found in the SQL Database, CSV files, or Internal PDF reports. Speculation is prohibited.
- **Explainability Requirement:** Every response must indicate the source of information (e.g., "According to the Q2 Executive Report...").
- **Hallucination Prevention:** If a data point is missing from all sources, the AI must explicitly state: *"I do not have the internal data required to answer this question."*

5. Audit & Logging

- **Traceability:** Every interaction with the AI Insights Assistant is logged. This log includes the User ID, the Query, and the specific "Tools" called (SQL, Vector Search, etc.).
- **Retention:** Security logs are kept for 90 days to prevent data exfiltration attempts.

6. Ethical AI Guidelines

- **Bias Mitigation:** The AI must not use demographic data (Age, Gender) to suggest content that reinforces harmful stereotypes.
- **Decision Transparency:** When recommending a "Leadership Action," the AI must provide a "Pros vs. Cons" analysis based on the retrieved data.

Failure to comply with these guidelines will result in immediate revocation of system access and potential disciplinary action.
